ii) The boiling point of ethylidene chloride is less than that of ethylene dichloride.

Chemical properties

1) Hydrolysis with aqueous NaOH or KOH

gem-Dihalides, on hydrolysis with aqueous KOH give an aldehyde or a ketone vic-Dihalides, on hydrolysis with aqueous KOH gives glycols.

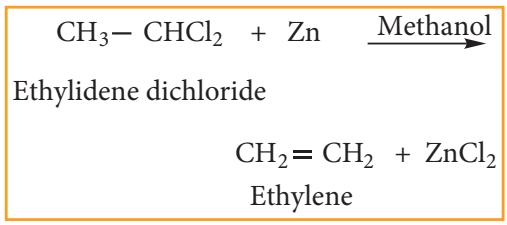

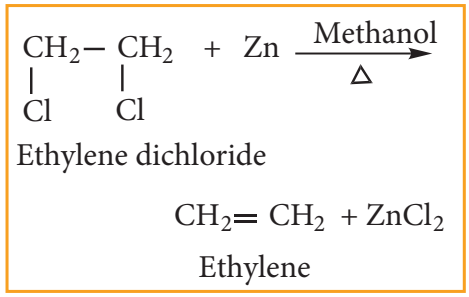

This reaction can be used to distinguish the gem- Dihalides and vic- Dihalides.

2) Reaction with Zinc (Dehalogenation)

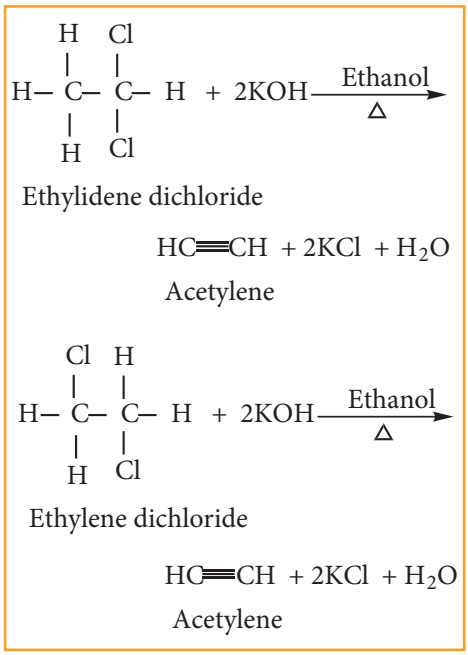

gem- Dihalides and vic- Dihalides on treatment with zinc dust in methanol give alkenes.

3) Reaction with Alcoholic KOH (Dehydrohalogenation)

gem- Dihalides and vic- Dihalides on treatment with alcoholic KOH give alkynes.

Methylene chloride (Di chloromethane)

Preparation

Methylene chloride is prepared by the following methods
