best understood by studying their internal structure by cutting sections either transverse or longitudinal or both of the part to be studied.

Requirements: Small twigs of locally available dicot and monocot plants, glycerine, safranin, slides, cover slip, brushes to prepare temporary slides and permanent slides of T.S. of Bean root, T.S. of Maize root, T.S. of Sunflower stem, T.S of Maize stem, T.S of Sunflower leaf, T.S of Grass leaf.

Start cutting transverse sections of material placing it in between pith. Select the thinnest section of the material with the help of a delicate brush. Take a clean watch glass with water, transfer thin sections of the material. Put a few drops of safranin stain in the watch glass with water. Leave it for 3-5 minutes. Drain off stain and wash with water if necessary. Put the thinnest section in the centre of the slide. Put a drop of glycerine over the material. Cover it with a coverslip with the help of needle. Observe it under a compound microscope after staining and mounting.
