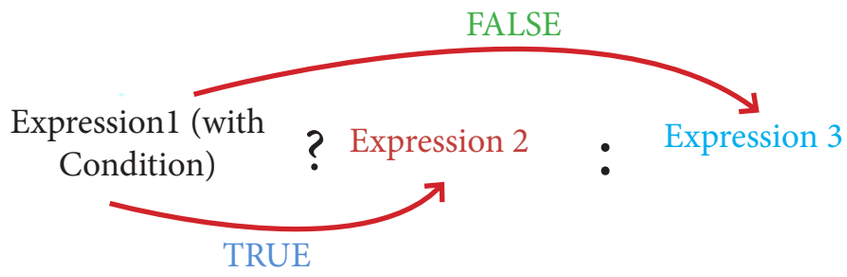
10.4.5 The ?: Alternative to if- else

The conditional operator (or Ternary operator) is an alternative for 'if else statement'. The conditional operator that consists of two symbols (?:). It takes three arguments. The control flow of conditional operator is shown below:

The syntax of the conditional operator is:

```
expression 1? expression 2 : expression 3
```



In the above syntax, the expression 1 is a condition which is evaluated, if the condition is true (Non-zero), then the control is transferred to expression 2, otherwise, the control passes to expression 3.

Illustration 10.5 – C++ program to find greatest of two numbers using conditional operator

```
#include <iostream>
using namespace std;
int main()
{
        int a, b, largest;
        cout << "\n Enter any two numbers: ";
        cin >> a >> b;
         largest = (a>b)? a : b;
        cout << "\n Largest number : " << largest;
        return 0;
}
```

Output:

```
Enter any two numbers: 12 98
Largest number : 98
```

10.4.6 Switch statement

The switch statement is a multi-way branch statement. It provides an easy way to dispatch execution to different parts of code based on the value of the expression. The switch statement replaces multiple if-else sequence.
