11.7.3 A Function without return value and with parameter

The name of the function is **display()**, its return type is void and it has two parameters or arguments **x** and **y** to receive two values. The **return** statement returns the control back to the calling statement.

Program 11 .22

```
#include<iostream>
using namespace std;
void display(int x, int y)
{
        int s=x+y;
        cout<<"The Sum of Passed Values: "<<s;
}
int main()
{
        int a=50,b=45;
          display(a,b);
        return(0);
}
```

Output :

The Sum of Passed Values: 95

11.7.4 A Function with return value and with parameter

The name of the function is display(), its return type is int and it has two parameters or arguments **x** and **y** to receive two values. The return statement returns the control back to the calling statement.

Program 11.23

```
#include<iostream>
using namespace std;
int display(int x, int y)
{
        int s=x+y;
        return s;
}
int main()
{
        int a=45,b=20;
        int s=display(a,b);
        cout<<"\nExample:Function with Return Value and  with Arguments";
        cout<<"\nThe Sum of Passed Values: "<<s;
        return(0);
}
```
