and computer science with geography has paved way for the development of modern cartography and GIS.

1.5.2 Geology and Geography:

Geology is the study of rocks, their types, distribution, mineral content, petroleum, etc. The subject investigates all these phenomena, classify them and put them in a sequence. Geography interacts with the subject in studying the distribution of exposed rocks, interaction with climate and human activities, economic prospects of the minerals and so on. Interaction between geology and geography leads to formation of the new branch of study called geomorphology, the study of landforms.

1.5.3 Physics, Chemistry and Geography:

As geography is the study of variable phenomena on the earth's surface, the dynamic mechanism of the phenomena requires to be studied within the framework of physics. The physics of atmosphere is studied under climatology and the physics of hydrosphere through oceanography, and both the subjects investigate, interpret and explain the atmospheric and hydrological processes. The chemical contents of rocks, soil, surface and groundwater, atmosphere are the interests of the geographers.

1.5.4 Botany, Zoology and Geography:

The systematic branches of botany and zoology have traditionally been confined to the classification and description of various kinds of species on the earth's surface. Geography, being the study of the spatial section of earth's surface, attempts to study the distributional aspects of flora and fauna especially with reference to climate and relief. The integration among these subjects has given birth to biogeography.

Relationship with Social Sciences

1.5.5. Economics and Geography

Economics is concerned with how human needs and wants are satisfied with the available resources. Economic geography is concerned with the study of resources endowment and patterns of utilisation. The economic activities of the human beings including agriculture, fishing, forestry, industries, trade and transport are studied in this branch. The economic activities are highly influenced by the relief and climatic factors of the region or the country. Therefore, economics and geography have close links with each other, especially for integrated resources development.

1.5.6 Sociology and Geography

Sociology is mainly concerned with the institutional aspects of the society. A number of investigations including social behaviour, movement of people between rural-urban areas, spatial interactions between social groups, the relations between innovation and tradition in rural and urban areas etc., have been jointly undertaken by sociologists and geographers in different countries of the world. Social geography is the logical expression of the interaction between sociology and geography as it studies social phenomena in spatial context.

1.5.7 Anthropology and Geography

Anthropology attempts to study human races and their classification. Both anthropology and geography seek to identify and classify the human races on the basis of their habitat and cultural traits and attempt to study the variable racial phenomena on the spatial context of the earth's surface. The relationship between anthropology and geography has resulted in
