are marked in the map with a triangle with the actual height of the place.

Hill Shading (levels of gray) is a method of representing relief on a map by depicting the shadows that would be cast by elevated areas if light was shining from a certain direction.

Layer Colouring is a method showing relief in layers and each layer is given a different colour. Physical maps in atlas and wall maps use this method to show relief features. Ocean depth is also shown in various shades of blue. There is an international recognition for colours used in these maps. Accordingly blue represents water bodies, green for plains, various shades of brown for highlands and white for snow covered peaks.
