Weather Map Interpretation

The Indian daily weather map is a political map of India, which also includes Pakistan, Afghanistan, part of China, Nepal, Bhutan, Myanmar and Sri Lanka with weather symbols indicating recorded weather data, isobars and keys for symbols.

Weather Map Interpretation – Monsoon Season (Example 1)

Weather map interpretation includes study and interpretation of all the weather parameters. The given weather map depicts the observed weather conditions on Monday 1st June 1992 at 08.30 Hrs I.S.T (0300 HRS GMT). Generally in India this observation is predicted as the southwest monsoon season that gives rain.

The key elements for weather map interpretation are:

1. **Range of Isobars:** From the given weather map it is observed that the isobars range from 1002 mb to 1010mb. The lowest value of 1002 mb is found over Bihar, Uttar pradesh and West Bengal as an enclosed isobar. The 1010 mb is the highest value and is observed in the extreme south western part of the Arabian Sea.
2. **Location of Low Pressure:** In this weather map, four low pressure zones are identified. Low pressure prevails in Bihar and West Bengal, North Western Pakistan, Assam, Eastern part of India and Lakshadweep Island.
3. **Location of High Pressure:** The high pressure prevails over Afghanistan with 1008mb and the other high pressure prevails over the south western part of the Arabian Sea with 1010 mb.
