it relates to. For example if the study is about a stream, it falls under the branch of physical geography, more specifically geomorphology - an exogenetic agent of denudation. The time frame that was planned for the fieldwork can be elaborated. If the field work is extending for more than one day, then a clear timetable should be given.

3. Need for the Study:

The reason why the field work is undertaken can be mentioned. This explains the need for the field work.

4. The Study Area:

Details of the study area are explained here – starting with the absolute or geographical location of the study area, the choice of the study area and the physiography of the area. Other known physical and cultural details of the study area can be mentioned here. A copy of the map, satellite image etc. can be incorporated here.

5. Methodology Used:

The methods used to carry out the field work have to be mentioned here. The method of information collection varies according to the type of study. It could be through observation, investigation, measurements; data collection from primary and secondary sources; field sketches, audio-video recording and photographs and GNSS surveys.

6. Data Analysis:

The data collected through field work should be presented in a simple way for easy analysis. The method of representation of data should be according to the method of data collected. Example: 1. If observation method is used in data collection then the data can be represented as photographs or field sketches. 2. If data is collected through surveys, it can be represented as a plan or map. 3. Data collected from secondary sources can be presented as tables, graphs, diagrams or charts. 4. Data collected through GNSS surveys can be mapped.

The data represented in various forms have to be neatly labeled and indexed for easy identification and understanding. The photographs, diagrams, tables, maps etc. prepared during post field work have to be arranged in a sequential order. So that they can provide an answer to the purpose of study and add more meaning and value to the report of work done in the field.

7. Conclusion:

The conclusion gives the gist of the field work – the aim, the results or findings and how it relates to existing knowledge and the addition of new knowledge through this field work. The conclusion has to present how the fieldwork has enhanced the theoretical knowledge gained in the class.

The table below gives a few steps in the preparation of field report for a few case studies under physical geography.
