5. ASCARIS

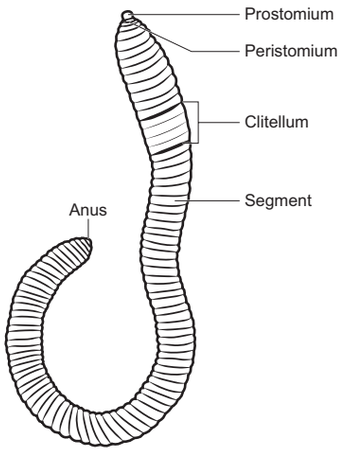

Identification:

The given specimen is identified as ***Ascaris*.** It belongs to the Phylum **Aschelminthes.**

Reasons for identification:

- Ascaris is a roundworm because it is circular in cross section.
- It is a triploblastic, pseudocoelomate animal.
- The unsegmented body is covered by a protective layer called cuticle.
- Alimentary canal is complete with a well developed mouth, pharynx and anus / cloaca.
- Sexes are separate and exhibit sexual dimorphism.
- Excretion is carried out through Rennet glands.
- It is an endoparasite.

6. EARTHWORM

Identification:

The given specimen is identified as **Earthworm.** It belongs to the Phylum **Annelida.**

Reasons for identification:

- Earthworm is a triploblastic, schizocoelomate animal.
- Its elongated body is segmented.
- The longitudinal and circular muscles in the body wall help in locomotion.
- The circulatory system is of closed type and the respiratory pigment haemoglobin is present in the plasma.
- It is a hermaphrodite animal.
