Significance:

- The stethoscope is used to hear the heart beat, sounds in the respiratory pathways, intestinal movements and also foetal movements.
- It helps to diagnose valve functions, lung diseases such as pneumonia, pleuritis and pulmonary oedema.
- Stethoscopes along with sphygmomanometer are used to measure blood pressure in humans.

24. SPHYGMOMANOMETER

Identification:

The medical apparatus kept for identification is the **sphygmomanometer**.

Significance:

- Sphygmomanometer is a device used to measure the blood pressure.
- Normal blood pressure is 120/80mmHg.
- 120 depicts the systolic pressure and 80 depicts the diastolic pressure.
- It helps to assess the state of blood circulation.
- Provides the functional details of heart.

25. GLUCOMETER

Identification:

The medical device kept for identification is the **Glucometer**.

Significance:

- It is a simple portable medical device used to record the approximate level of blood glucose.
- The glucometer neads the blood sample and displays the glucose levels in the units of mg/dL.
- Most glucometers are based on the electrochemical technology or colour reflectance principle.
- Normal blood glucose value is 70-110mg/dL.
