

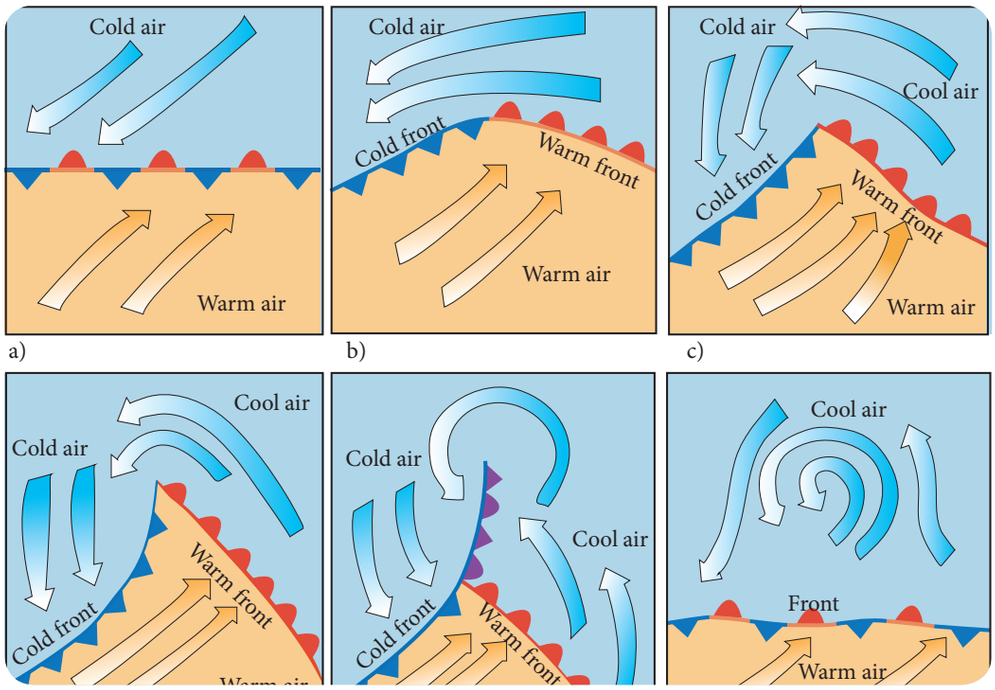

Figure 6.35 Development of Temperate cyclone

6.7.4 Stages in the Formation of Temperate Cyclone

a. Frontogenesis –Formation of front due to collision of two contrasting air masses (Figure 6.35).

b. Cyclone genesis – Formation of cyclone due to conversion of fronts into various sectors.

c. Advancing Stage – The stage where cold front advances towards warm front.

d. Occlusion stage - The stage where the cold front over takes warm front

e. Frontalysis – The last stage where fronts disappear and cyclone ends its life.

Characters

Unlike tropical cyclone, temperate cyclone forms over both land and water in all seasons. It covers larger area than tropical cyclone and stays for a longer period.

Condition of Super Cyclone Formation

1. Longer travel or stay of low pressure system over warm ocean water.
2. The speed of jet stream may influence the formation of super cyclone.

Track

Temperate cyclone moves along with the westerly wind system from west to east.

Anti Cyclones

Anti cyclone is a whirlwind system in which high pressure area at the centre and surrounded by low pressure at periphery rotating clockwise in northern hemisphere and anti clock wise in southern hemisphere(Figure 6.36).

This is the largest among the whirl wind systems. Normally, they are associated with high pressure belts of sub tropical and polar region.
