```
        else
        {
                commission = sales * 0.05;
                cout << "\n Commission: " << commission;
        }
        cout << "\n Good Job ..... ";
        return 0;
}
```

Output:

```
Enter Sales amount: 6000
Enter Grade: A
Commission: 600
Good Job .....
```

10.4.4 if -else-if ladder

The if-else ladder is a multi-path decision making statement. In this type of statement '**if**' is followed by one or more **else if** statements and finally end with an **else** statement.

The syntax of if-else ladder:

```
if (expression 1)
{
  Statement-1
}
else
        if( expression 2)
        {
                Statement-2
        }
        else
                if ( expression 3)
                {
                        Statement-3
                }
                else
                {
                        Statement-4
                }
```

When the respective expression becomes true, the statement associated with block is executed, and the rest of the ladder is bypassed. If none of the conditions is true, then the final else statement will be executed.
