Program 11.3

```
#include<iostream>
#include<stdio.h>
#include<ctype.h>
using namespace std;
int main()
{
        char ch;
        int r;
        cout<<"\n Type a Character :";
        ch = getchar();
        r = isalnum(ch);
        cout<<"\nThe Return Value of isalnum(ch) is :"<<r;
}
```

Output-1:

```
Type a Character :A
The Return Value of isalnum(ch) is :1
```

Output-2:

```
Type a Character :?
The Return Value of isalnum(ch) is :0
```

11.4.2.2. isalpha()

The isalpha() function is used to check whether the given character is an alphabet or not.

General Form:

isalpha(char c);

This function will return 1 if the given character is an alphabet, and 0 otherwise 0. The following statement assigns 0 to the variable n, since the given character is not an alphabet.

int n = isalpha('3');

But, the statement given below displays 1, since the given character is an alphabet.

cout << isalpha('a');
