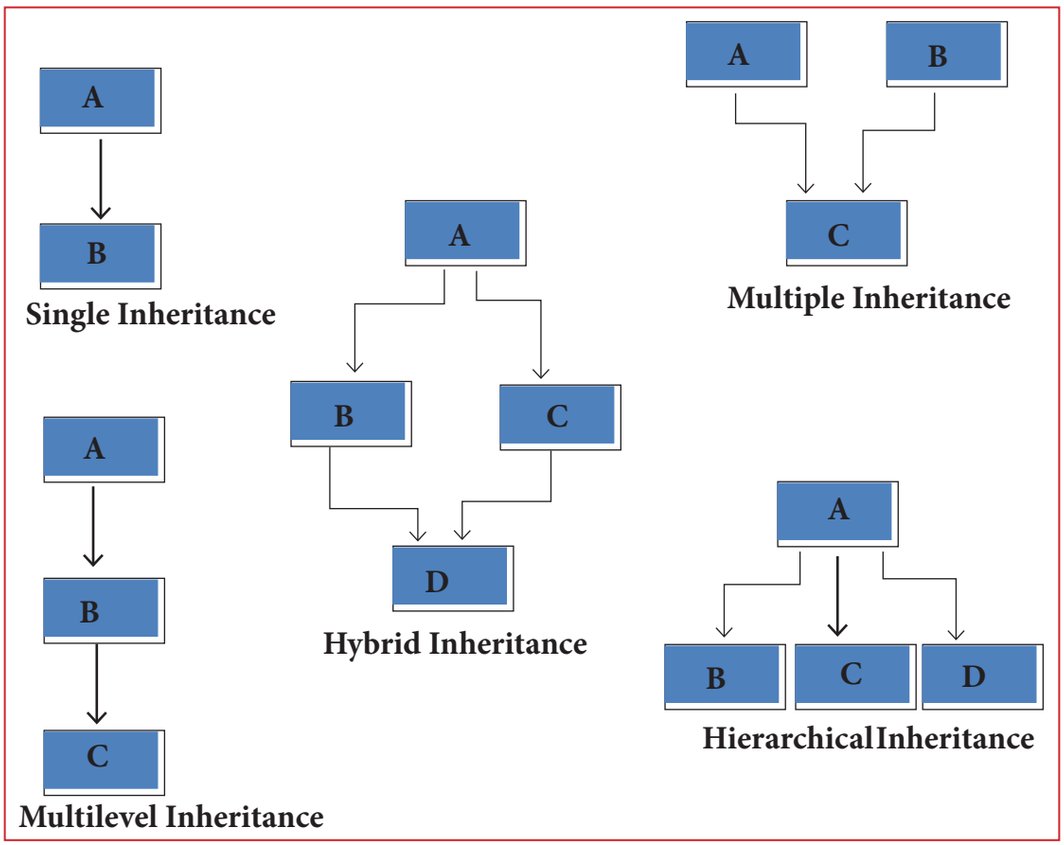
4. Multilevel Inheritance

The transitive nature of inheritance is reflected by this form of inheritance. When a class is derived from a class which is a derived class – then it is referred to as multilevel inheritance.

5. Hybrid inheritance

When there is a combination of more than one type of inheritance, it is known as hybrid inheritance. Hence, it may be a combination of Multilevel and Multiple inheritance or Hierarchical and Multilevel inheritance or Hierarchical, Multilevel and Multiple inheritance.

The following diagram represents the different types of inheritance



16.4 Derived Class and Base class

While defining a derived class, the derived class should identify the class from which it is derived.The following points should be observed for defining the derived class.

i The keyword class has to be used

ii The name of the derived class is to be given after the keyword class

iii A single colon (:)

iv The type of derivation (the visibility mode), namely private, public or protected. If no visibility mode is specified ,then by default the visibility mode is considered as private.

v The name of the base class(parent class), if more than one base class, then it can be given separated by comma.
