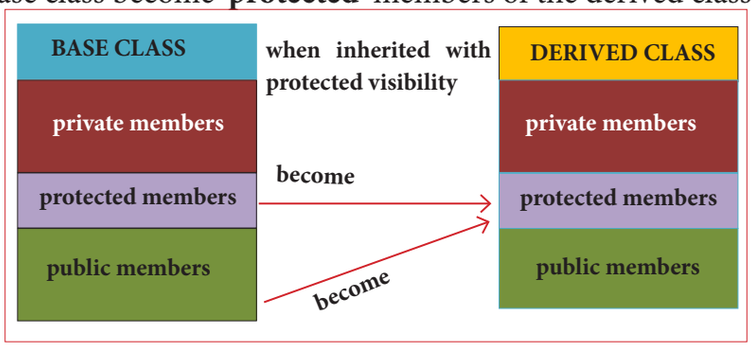
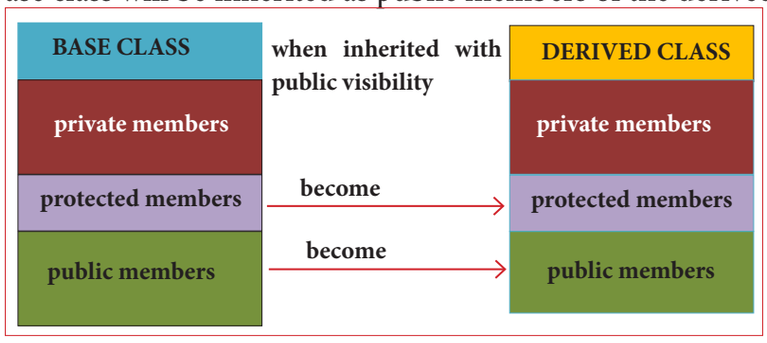
16.5.2 protected visibility mode

When a base class is inherited with **protected** visibility mode the protected and public members of the base class become '**protected**' members of the derived class



16.5.3 public visibility mode

When a base class is inherited with **public** visibility mode , the protected members of the base class will be inherited as **protected** members of the derived class and the **public** members of the base class will be inherited as public members of the derived class.



Tip Notes

When classes are inherited with public, protected or private the private members of the base class are not inherited they are only visible i.e continue to exist in derived classes, and cannot be accessed

Illustration 16.3 Explains the significance of different visibility modes.

```
//Implementation of Single Inheritance using public visibility mode
#include <iostream>
using namespace std;
class Shape
{    private:
          int count;
   protected:
          int width, height;
  public:
          void setWidth(int w)
          {          width = w;      }
void setHeight(int h)
{ height = h; } };
```
