

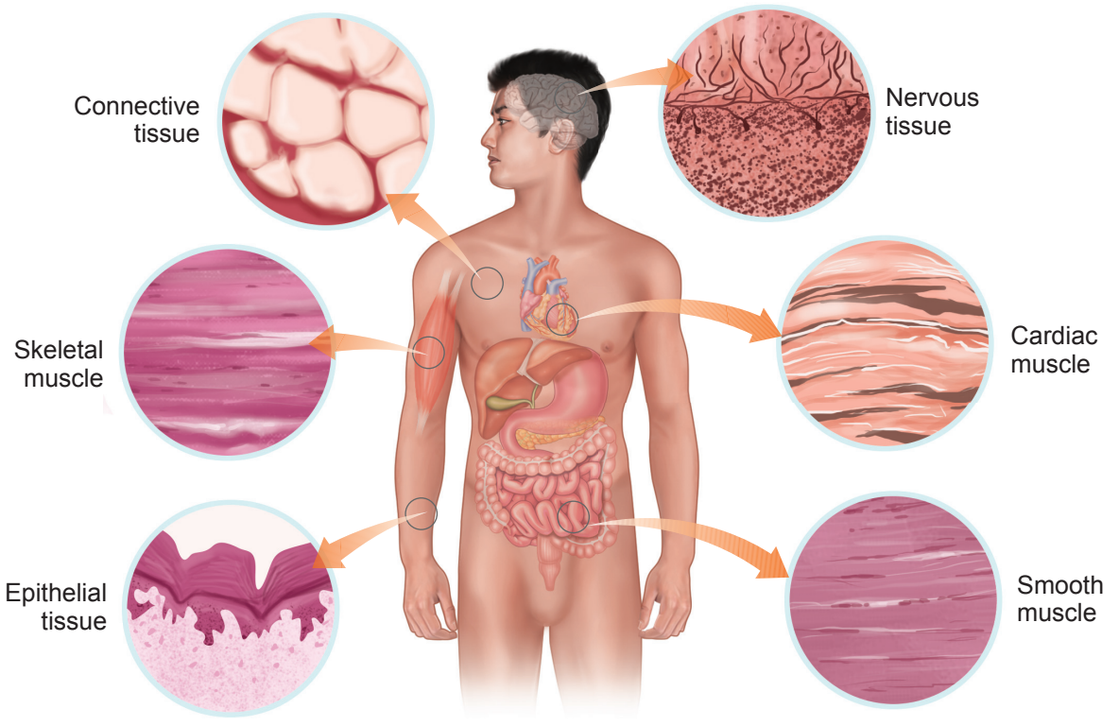

Figure 3.1 Types of Tissues in Human

3.2 Epithelial Tissue

Epithelial tissue is a sheet of cells that covers the body surface or lines the body cavity. It occurs in the body as a **covering, as a lining epithelium and as glandular, epithelium**. The functions of epithelium includes **protection, absorption, filtration, excretion, secretion** and **sensory reception.**

Based on the structural modification of the cells, the epithelial tissues are classified into simple epithelium and compound epithelium or stratified epithelium.

Simple epithelium is composed of a single layer of cells. They are found in the organs of absorption, secretion and filtration. Simple epithelial tissue is further classified

Classification of Animal Tissues

- **Epithelial Tissue**
  - **Simple Tissue**
    1. Squamous
    2. Cuboidal
    3. Columnar
    4. Ciliated
    5. Pseudostratified
  - **Compound Tissue**
    - **Stratified**
      - **Squamous**
        1. Keratinized
        2. Non-Keratinized
      - **Cuboidal**
      - **Columnar**
    - **Transitional**
- **Connective Tissue**
- **Muscular Tissue**
- **Neural Tissue**
