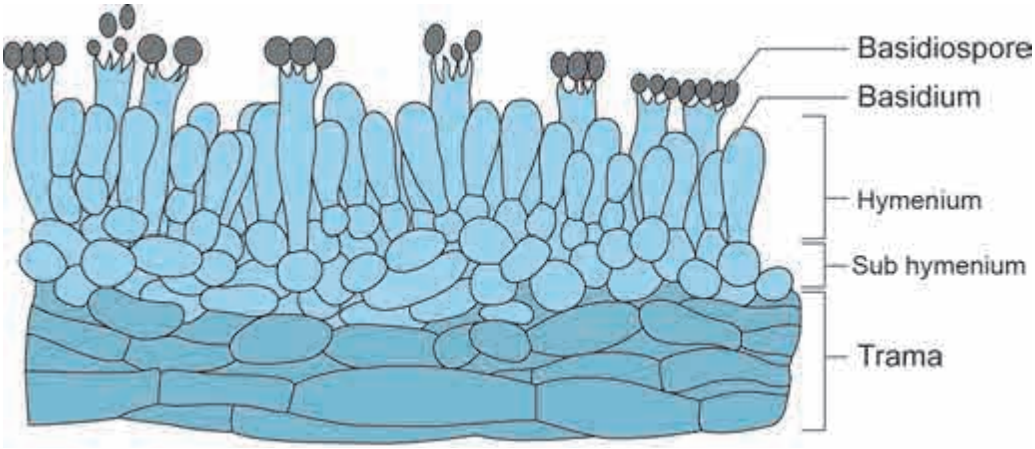

Figure 1.29: V.S. of *Agaricus* gill

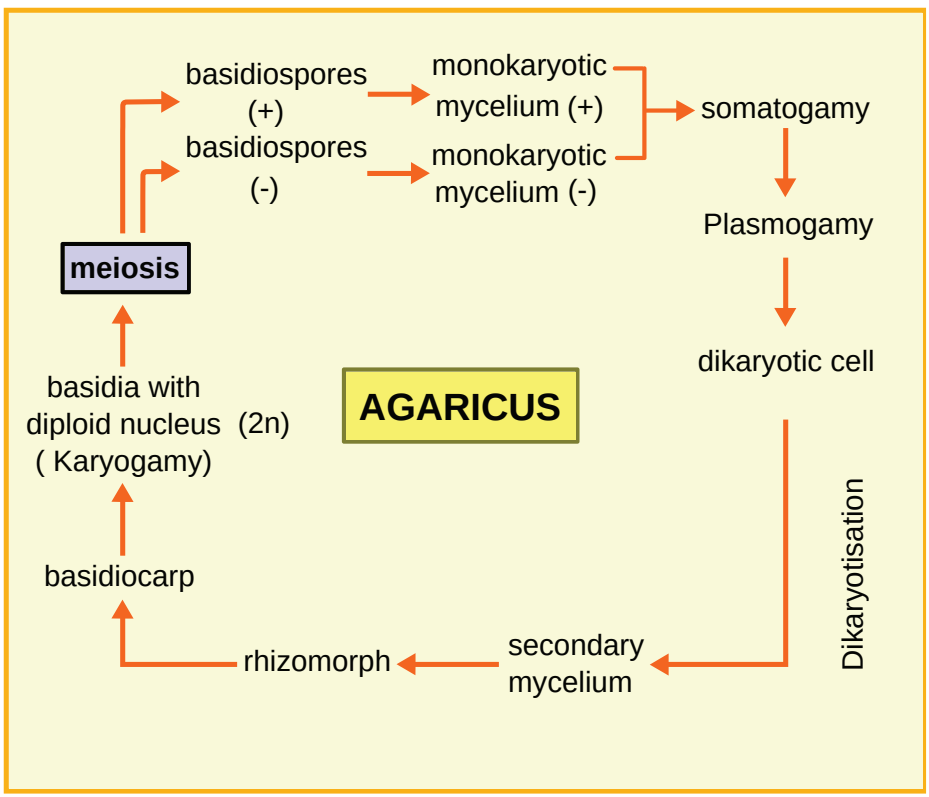

Figure 1.30: Life Cycle of *Agaricus*

the haploid primary mycelium.

Thus the life cycle of *Agaricus* shows a very short diploid phase, haploid phase and a prolonged dikaryotic phase (Figure 1.30).

1.5.9 Mycorrhizae

The symbiotic association between fungal mycelium and roots of plants is called as mycorrhizae. In this relationship fungi absorbs nutrition from the root and in turn the hyphal network of mycorrhizae forming fungi helps the plant to absorb water and mineral nutrients from the soil (Figure 1.31) Mycorrhizae are classified into three types

Importance of Mycorrhizae

- Helps to derive nutrition in *Monotropa*, a saprophytic angiosperm,
- Improves the availability of minerals
