Aquatic habitat		
Types	**Nature of environmental adaptation**	**Example**
Free Floating	Growing on water surface	*Eichhornia, Trapa, Pistia, Lemna*
Submerged	Plants growing completely under water	*Hydrilla, Vallisneria*
Emergent	Plants with roots or stems anchored to the substrate under water and aerial shoots growing above water	*Limnophyton, Typha*
Floating leaved	Anchored at bottom but with floating leaves	*Nelumbo, Nymphaea*
Mangroves	Plants growing emergent in marshy saline habitat	*Avicennia, Rhizophora*

I. Annual (Therophyte or Ephemerals)

A plant that completes its life cycle in one growing season. Example: Peas, maize, water melon, groundnut, sunflower, rice and so on.

II. Biennial

A plant that lives for two seasons, growing vegetatively during the first season and flowering and fruiting during the second season. Example: Onion, Lettuce, Fennel, Carrot, Radish, Cabbage and Spinach.

III. Perennial (Geophyte)

A plant that grows for many years that flowers and set fruits for several seasons during the life span. When they bear fruits every year, they are called **polycarpic.** Example: mango, sapota. Some plants produce flowers and fruits only once and die after a vegetative growth of several years. These plants are called **monocarpic**. Example: *Bamboo, Agave, Musa, Talipot palm.*

3.4 Parts of a flowering plant

Flowering plants are called **"Angiosperms"** or **Magnoliophytes**. They are sporophytes consisting of an axis with an underground **"Root system"** and an aerial **"Shoot System".** The shoot system has a stem, branches and leaves. The root system consists of root and its lateral branches.

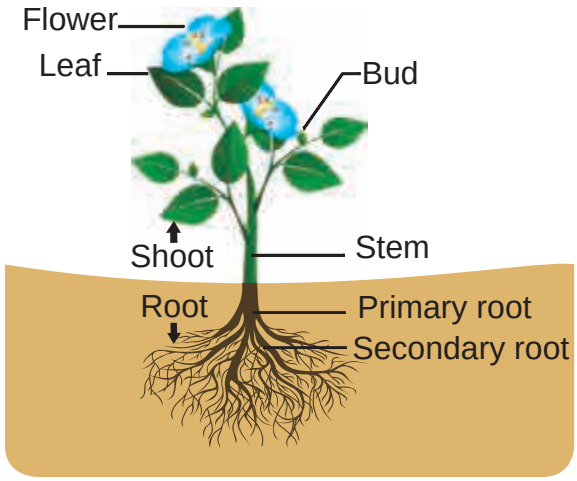

Figure: 3.1: Parts of a flowering plant

3.5 Root System

The root is non-green, cylindrical descending axis of the plant that usually grows into the soil (positively geotropic). It develops from the radicle which is the first structure that comes out when a seed is placed in the soil. Root is responsible for absorption of water and nutrients and anchoring the plant.
