Hypogynous: The term is used for sepals, petals and stamens attached at the base of a superior ovary. Example: Malvaceae	**Epihypogynous:** The term is used for sepals, petals and stamens attached at the middle of the ovary (half-inferior). Example: Fabaceae, Rosaceae.	**Epigynous:** The term is used for sepals, petals and stamens attached at the tip of an inferior ovary. Example: cucumber, apple, Asteraceae.
5GRG6V	**Perigynous:** The term is used for a hypanthium attached at the base of a superior ovary.	**Epiperigynous:** The term is used for hypanthium attached at the apex of an inferior ovary.

4.5.7 Perianth / androecial position on thalamus:

It describes placement of the perianth and androecium relative to the ovary and to a hypanthium, if present.

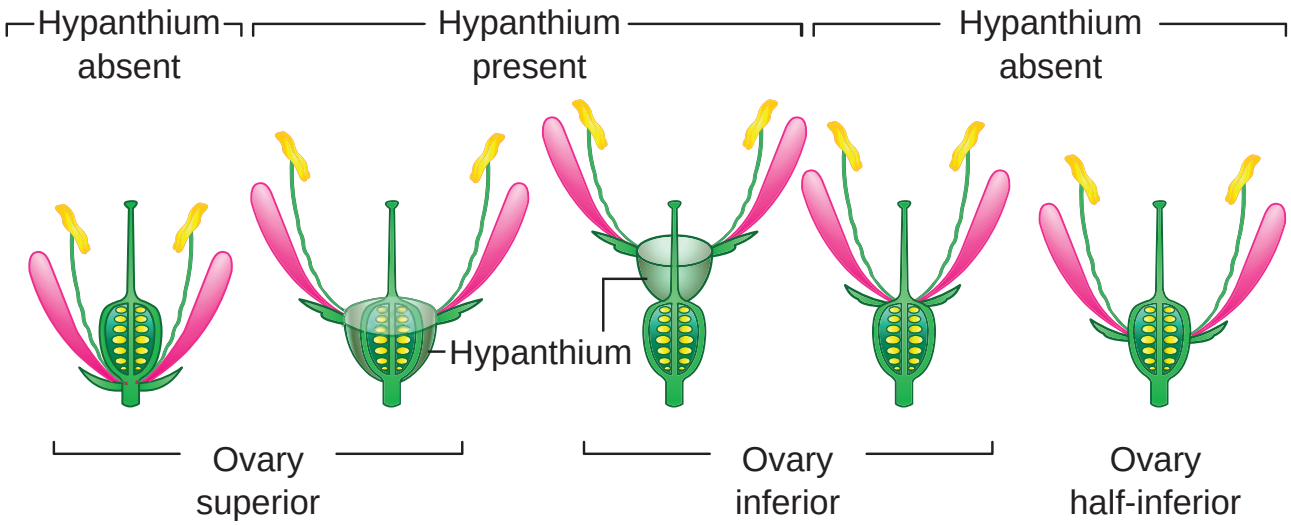

Figure 4.37: Perianth / androecial position on thalamus

Parietal axile: It is with the placentae at the junction of the septum and ovary wall of a two or more locular ovary. Example: Brassicaceae.	**Apical pendulous** It is with placenta at the top of ovary. Ovules hanging down.
Parietal septate: It is with placentae on the inner ovary walls but within septate locules as in Aizoaceae.	**Apical axile** It is with two or more placentae at the top of a septate ovary. Example: Apiaceae.
