erecto folius compositis. It means butter cup with reflexed sepals, curved flower stalks, erect stem and compound leaves. Polynomial system did not hold good as it was cumbersome to remember and use. Polynomial system of naming a plant is replaced by a binomial system by Linnaeus.

Binomial

Binomial nomenclature was first introduced by **Gaspard Bauhin** and it was implemented by **Carolus Linnaeus**. Scientific name of a species consists of two words and according to binomial nomenclature, the first one is called **genus name** and second one is **specific epithet.** Example: *Mangifera indica*. *Mangifera* is a genus name and *indica* is specific epithet. This system is in vogue even now.

Author citation

This refers to valid name of the taxa accompanied by the author's name who published the name validly. Example: *Solanum nigrum* L. There are two types of author citation.

Single author: When a single author proposed a valid name, the name of the author alone is accompanied by his abbreviated name. Example: *Pithecellobium cinereum* Benth.

Multiple authors: When two or more authors are associated with a valid publication of name, their names should be noted with the help of Latin word *et* or &.

Example: *Delphinium viscosum* Hook. f. *et* Thomson.

Standard form of author's abbreviations has to be followed.

Author	Standard form of Abbreviation
Linnaeus	L.
G.Bentham	Benth.
William Hooker	Hook.
Robert Brown	R.Br.
J.P.Lamarck	Lamk.
A.P.de Candolle	DC.
Wallich	Wall.
Alphonse de Candolle	A. DC.

5.5 Type concept

ICN's second principle states that a specimen must be associated with the scientific name known as **nomenclatural type.** A nomenclatural type is either a specimen or may be an illustration. Example: Herbarium sheet for vascular plants.

There are different nomenclatural types.

Holotype: A specimen or illustration originally cited by the author in protologue. It is a definitive reference source for identity. Citation of holotype and submission of it is one of the criteria for valid publication of a botanical name.

Isotype: Duplicate specimen of the holotype collected from same population by same person on same date with same field number. They are the reliable duplicates of holotype and may be distributed to various herbaria of various regions.

Lectotype: Specimen selected from original material serves as a type, when no holotype was designated at the time of publications or if holotype is missing or destroyed.
