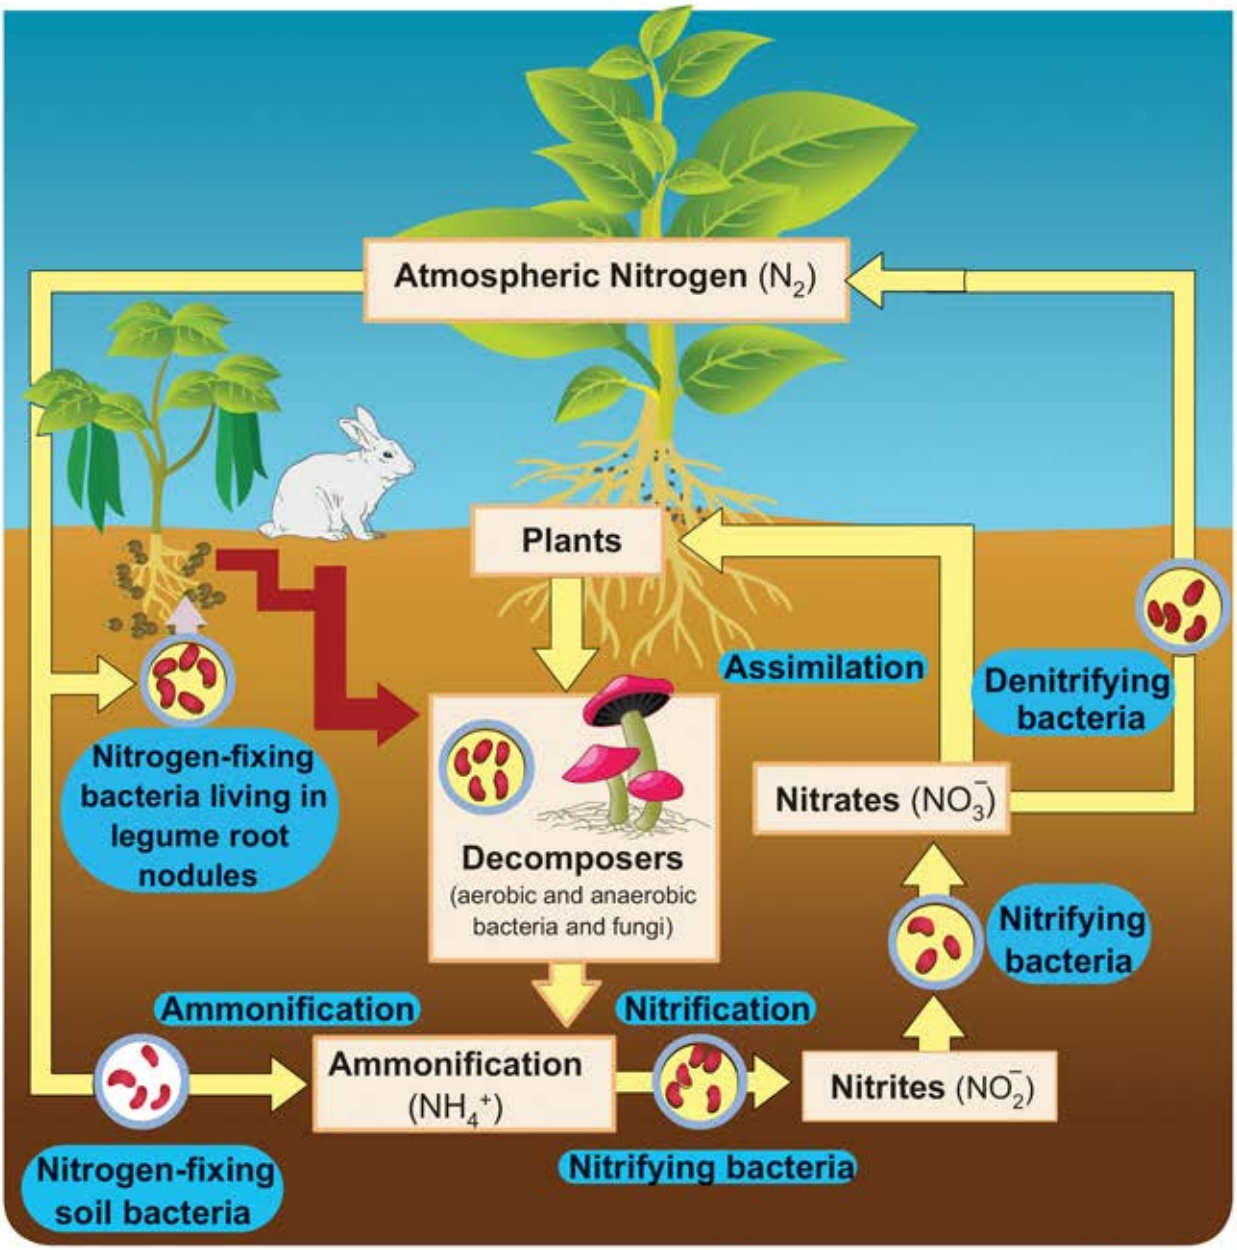

Figure 12.8: Nitrogen Cycle

$$\alpha\text{-Ketoglutaric acid} + NH_4^+ \xrightarrow[NADPH+H^+ \;\; NADP^+]{\text{Glutamate dehydrogenase (GDH)}} \text{Glutamate} + H_2O$$

2. Transamination

Transfer of amino group (NH_3^+) from glutamic acid glutamate to keto group of keto acid. Glutamic acid is the main amino acid from which other amino acids are synthesised by transamination. Transamination requires the enzyme transaminase and co enzyme pyridoxal phosphate (derivative of vitamin B6 -pyridoxine)
